

SUBSTITUTE PARAGRAPH  
PAGE 2, LINES 23-30 OF SEPCIFICATION

The rotor 30 is mounted in the stator 20 and is rotatable relative to the stator 20 through the medium of two radial bearings 31, 32 and one axial bearing 33. The illustrated rotor 10 is of the so-called wing type, wherewith spring-biased wings 34 on the rotor 30 define, together with the inner surface 24 25 of the stator and the outer surface 35 of the rotor, those working chambers 36, 37 required for rotation of the rotator. The rotator has a multi-rotational and reversible rotational capacity.
